

VigiControl

Real-time tracking of guards and patrols

Live GPS tracking

Optimized dispatches

Randomized presence check

Exceptional client service ensured

Incident reporting with multimedia evidence

Instant man-down and missed checkpoint alerts

Available on:

Android

Streamline your security operations

Real-time tracking of guards and patrols

VigiControl is a robust guard tour system meticulously designed to provide a complete view of your security guards' activities and operations.

This system comprises two key components: the module within SoftGuard's Desktop Security Suite, designed for your control room, and the mobile application, compatible with any Android 8 or newer device.

SOS

Instant help at the touch of a button, equipped with location sharing and the capability to attach multimedia

Patrol Rounds

Notifications for checkpoint arrivals and departures are seamlessly transmitted through GPS, QR codes, NFC tags, or Bluetooth beacons, ensuring comprehensive patrol oversight with real-time alerts in case of non-compliance.

Alive Signal

Guards are periodically prompted to confirm their presence through random checks. Failure to respond within the set timeframe triggers an automatic alert.

News

Guards can transmit updates and critical information to the monitoring center or supervisor, including written notes, images, videos, and audio recordings.

Assignment

Effortlessly connect operators at the control room with guards on the field. Dispatch a security guard to respond to an alarm event with all pertinent information, requiring just 2 clicks.

Design

Customize the app's interface with your logo and colors, creating a cohesive and professional image for your organization.

Worked hours reports

Generate accurate reports based on login and logout timestamps for efficient hour tracking.

Restrictions

Set alerts to notify you if two guards breach a predefined distance threshold or if a guard remains stationary for longer than a set duration.

Extra Features

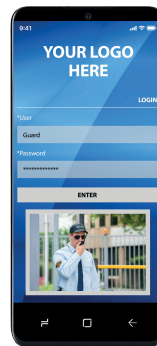

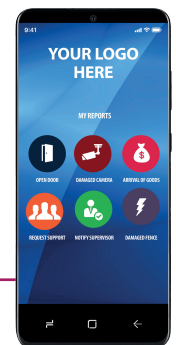

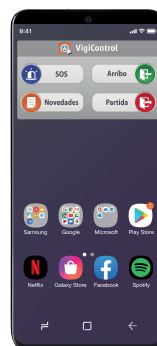

Photo Verification

VigiControl captures a photo with the front camera during login for precise identification.

A set of customizable buttons to enhance communication according to your company's needs. Guards can report tampered cameras, damaged fences, package arrivals... it's up to you!

Widget for easy access to SOS alerts, news updates, and checkpoint arrivals and departures.

Supervisors can personally create patrol routes using the app, providing greater control over the guard's estimated time of arrival at each checkpoint.
